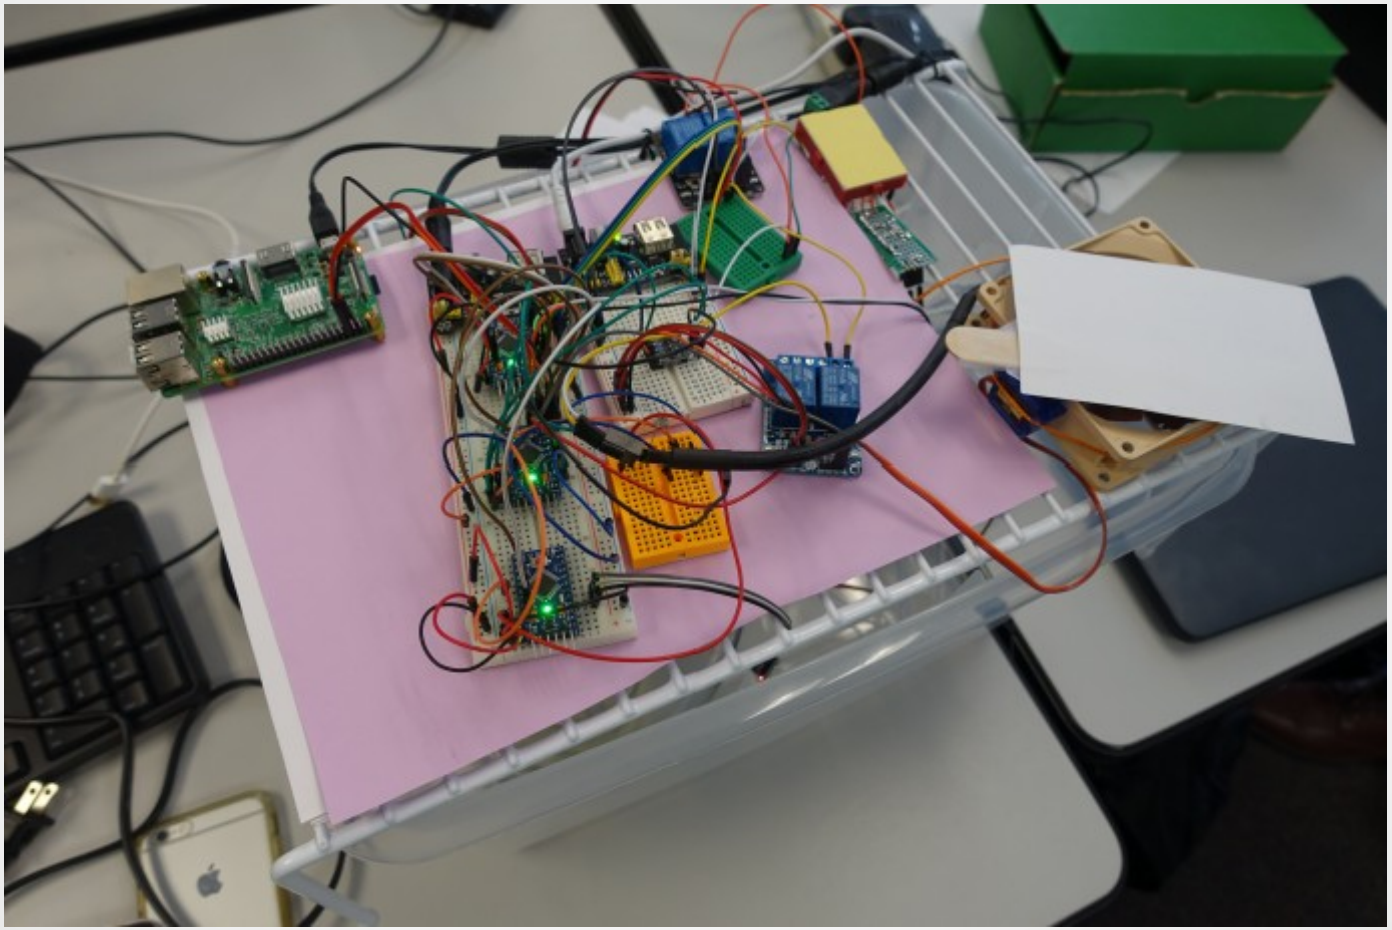
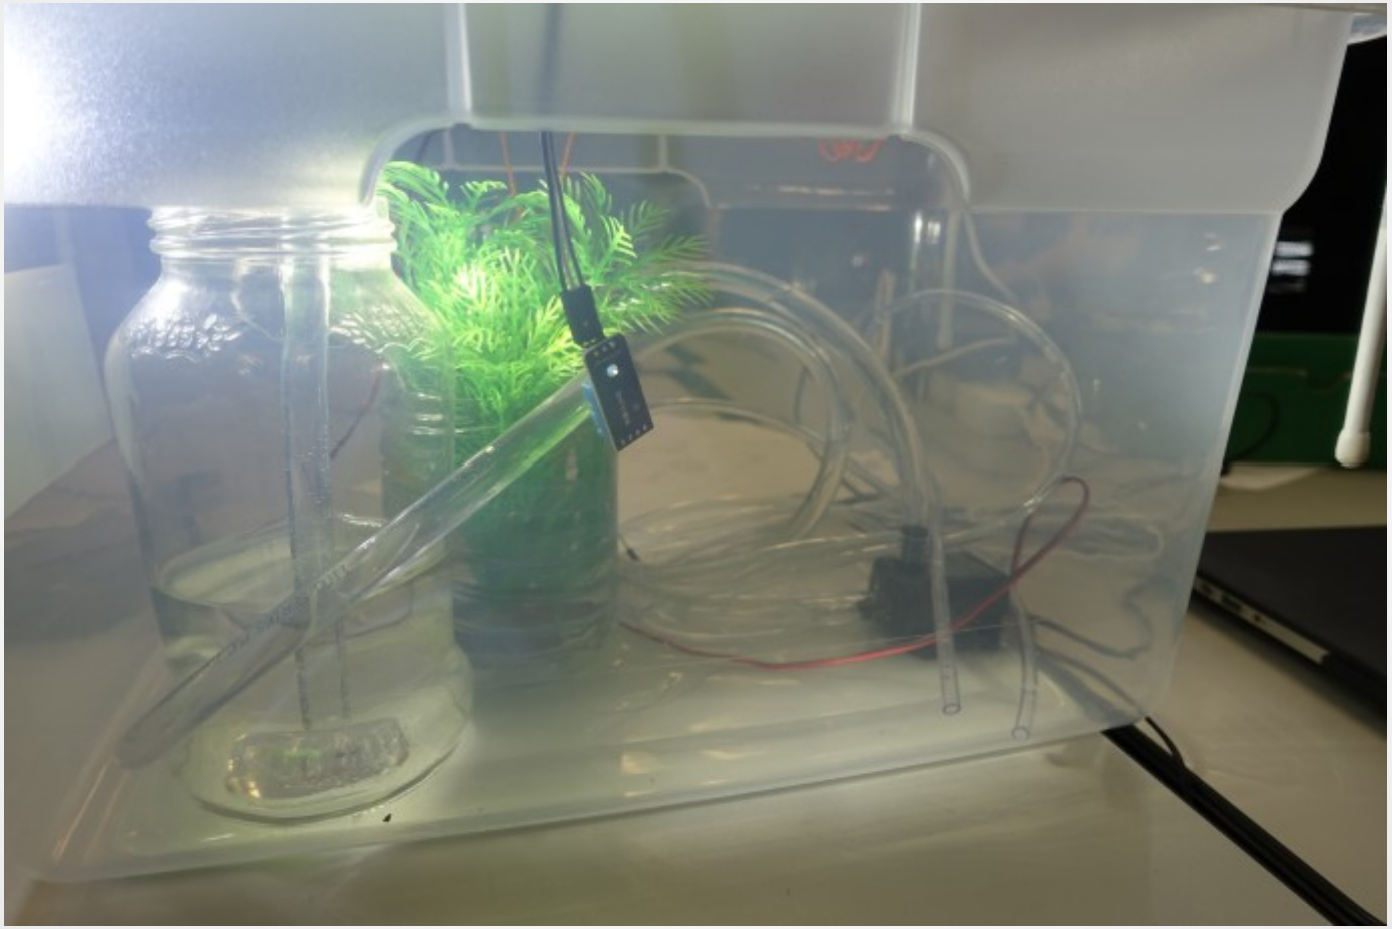
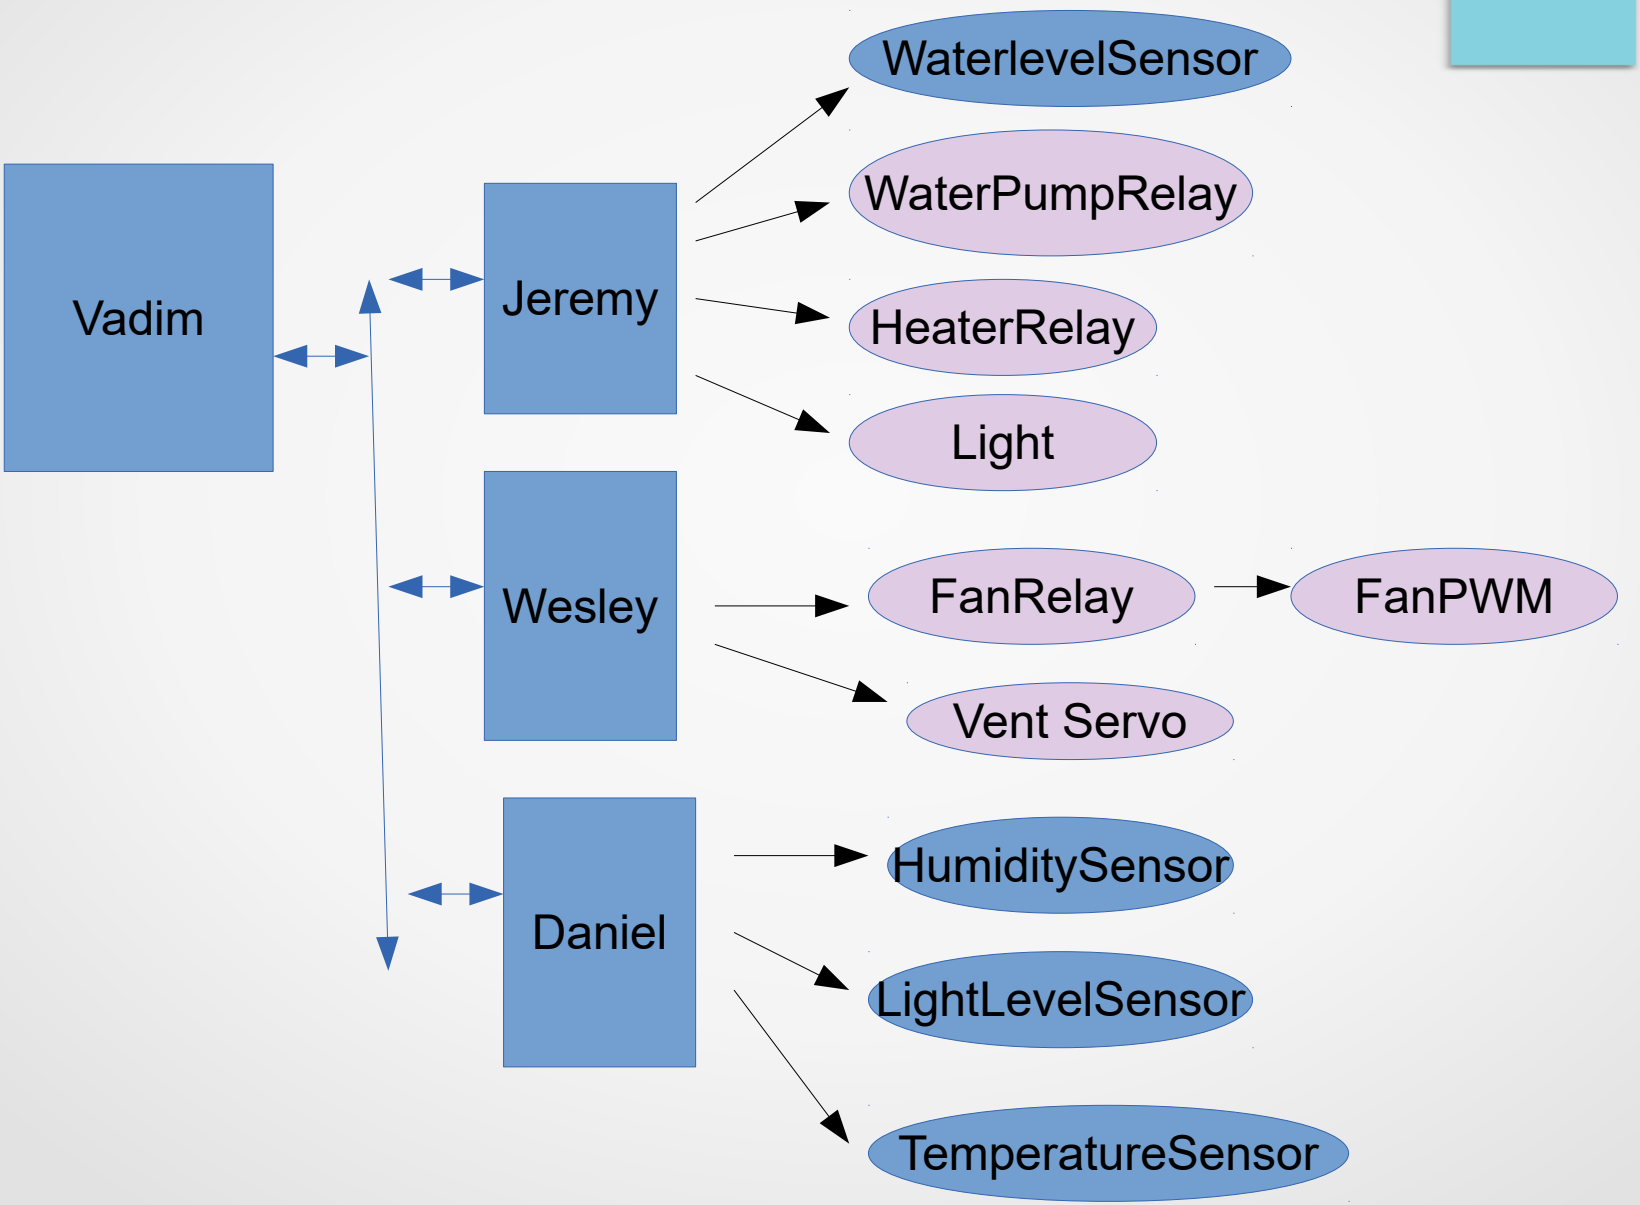
Upper Level Deck



Lower Level Bin

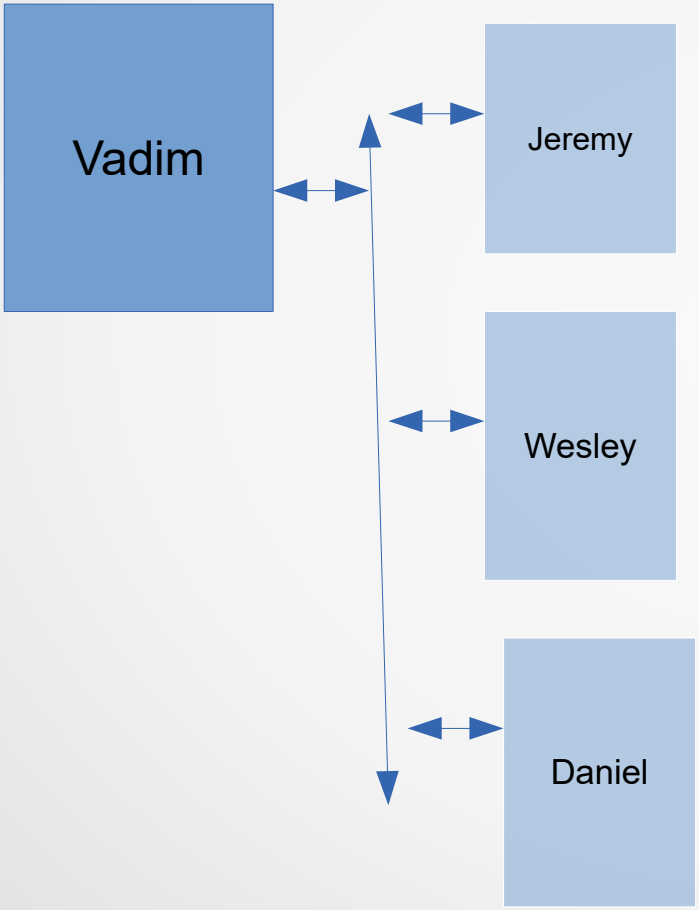


Overview



Vadim
Jeremy
Wesley
Daniel
WaterlevelSensor
WaterPumpRelay
HeaterRelay
Light
FanRelay
FanPWM
Vent Servo
HumiditySensor
LightLevelSensor
TemperatureSensor

Vadim



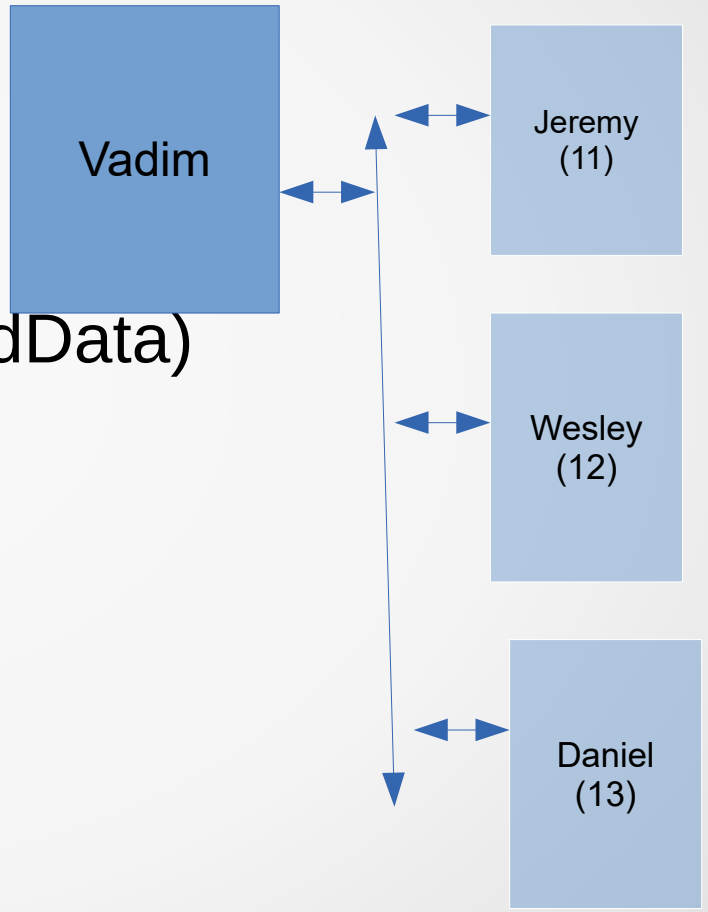
- CLI to directly poll sensors and control peripheral devices

-Web server to give current sensor readouts

-acts as I2C master to drive the I2C bus

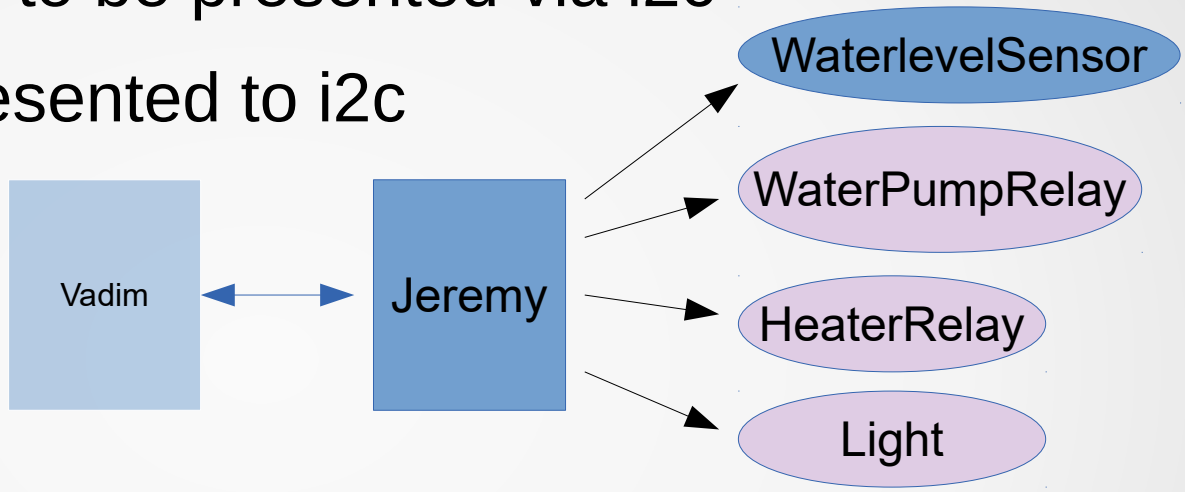
Aside: I2C

- Setup in a poll – respond format
- Example:
  - V: bus_write(address, request)
  - J/W/D: onRequest(V, requestedData)
  - V: int x = readNumber()



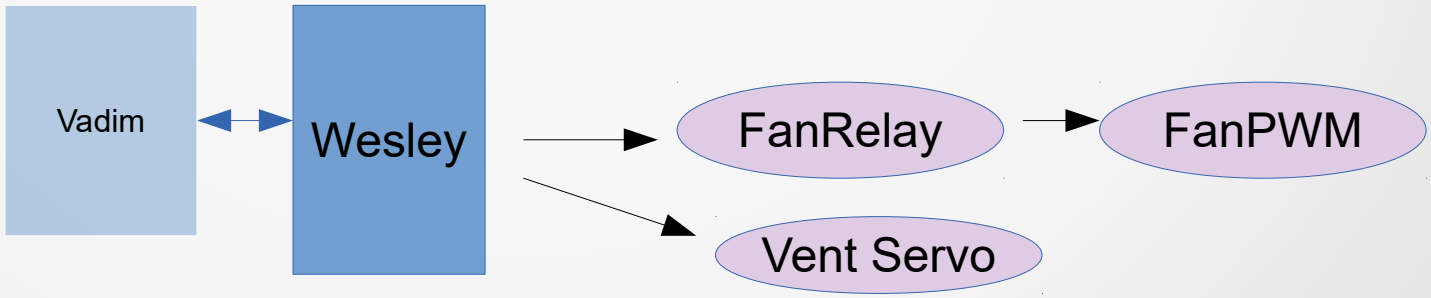
Jeremy (I2C address 11)

- Sensors abstracted to be presented via i2c
- Relays and light presented to i2c



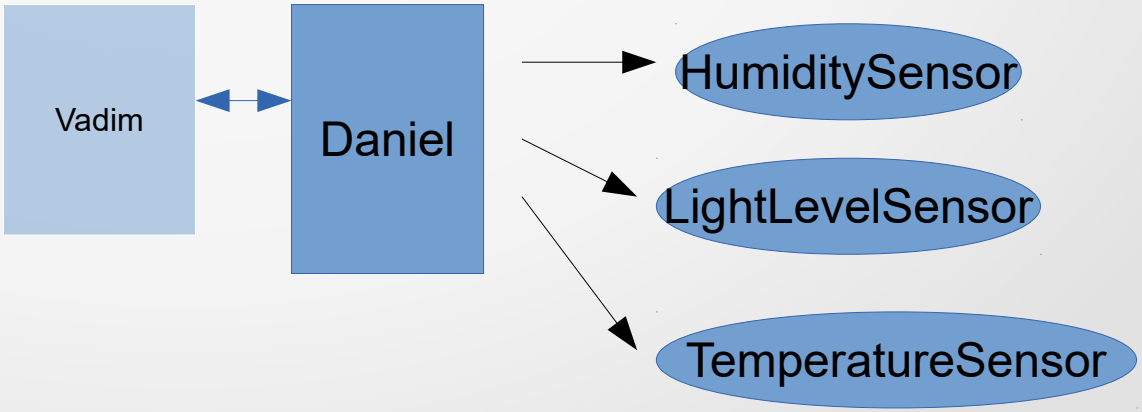
Wesley (I2C address 12)

- Presents Fan control (relay and PWM) to I2C



Daniel (I2C address 13)

- Presents Light level reading from ADC to I2C
- Presents Humidity/Temp from DHT11 to I2C
  - DHT11 has a maximum 1Hz refresh cycle, so the interstitial arduino automatically polls the DHT11 and stores the values locally to present to I2C master



Simplification

- Only need one microcontroller with network interface
- Reduce down to two relays:
  - Heater
  - Pump

Thanks!
